INSTALLATION OF POLSAT BOX SATELLITE DISH

17, november | Rating **4.8** out of 75 votes

The adventure with digital television begins with signing a contract and picking up a decoder from the Polsat Box showroom. If you have a community installation in your building, it is enough to plug the decoder into a wall socket; if you live in a detached house, you should order satellite dish installation offered by an authorized Polsat Box technical service or a local installer recommended by the digital TV operator's showroom. The exception is Polsat Box Go Internet TV, which can be received only with Internet from any operator and an application installed on the TV or a dedicated OTT decoder.

satellite dish installation

Deciding on satellite TV, the decoder model is chosen depending on the type of TV you have, for older models HD resolution is enough, for newer TV sets you will need equipment that supports 2160P technology. The cable connecting the decoder to the TV should provide a bandwidth of 18Gbps and support for the HDCP protocol, on cables that do not meet the above conditions you will not get Ultra High Definition images. Owners of a good audio set or home theater have the option of sending multichannel audio through an optical cable, or fiber optic cable, providing compatibility with DTS, Dolby Audio, etc.

Which satellite dish to choose ? The one offered by the Polsat operator or buy on the open market something with a larger diameter ? Definitely the second option, the set of the decoder comes with a 65 cm dish, which does not give us a reserve for bad weather, look for 80-90cm dishes and unicable converters in electronic stores, the most popular at the moment are Opticum and Inverto. To mount the satellite set we use special brackets, it can be a structure to the wall or chimney or a bracket to the balcony railing, mounting pins should have a diameter of 12-14mm and a minimum length of 120mm, if on the wall is insulated we use metal anchors with a collar to prevent denting. The coaxial cable connecting the antenna to the decoder can be covered with a white gutter, you can buy it in one of the DIY stores in Warsaw, we attach it to the wall with double-sided tape or glue resistant to moisture and water.
